

Kit #101063

Lift Kits - Mede in USA	
Step 1	Step 2
Jack up truck and place jack stands under frame	Remove front wheels and brackets holding the ABS lines and hydraulic lines.
Step 3	Step 4
Remove tie rod end.	Remove axle nut dustcap.
Step 5	Step 6
Remove axle nut, failure to do this step may cause CV joint to separate.	Remove upper ball joint nut, and separate upper ball joint by lightly tapping steering knuckle with large hammer.
Step 7	Step 8
Remove sway bar end link at spindle.	Remove lower strut mount nuts.
Step 9	Step 10
Put downward pressure on lower arm until studs pop free.	Remove upper nuts after studs are clear of lower control arm, and remove strut from vehicle

Kit #101063

Step 11	Step 12
Install Traxda plates on top of strut.	Reinstall strut into truck using supplied nuts
Step 13	Step 14
Using floor jack under lower control arm, apply pressure and reattach upper ball joint.	Reattach sway bar end link, as well as ABS and other brackets
Step 15	Step 16
Before reinstalling axle nut, make sure that axle is fully engaged to hub, do not use an impact gun. Improper assembly may damage vacuum actuator. To test, rotate wheel hub and the axle should rotate if properly engaged.	Make sure CV joint is properly seated before tightening axle nut.
Step 17	Step 18
Tighten axle nut.	Repeat on other side.
Step 19	Step 20
Reinstall wheels and test drive.	Have alignment performed. Toe setting will change with ride height change
